SYNOPSIS

The Cosmetic Shop Management System is a web-based application developed to manage the daily operations of a cosmetic shop efficiently. It helps in handling product details, customer information, sales records, and stock management in a systematic and digital way. This system reduces manual work and improves accuracy.

The main objective of this project is to automate the shop management process. The admin can add, update, and delete product details, maintain customer records, and track sales easily. It also provides a simple billing system for generating bills and maintaining transaction records.

The system is developed using HTML, CSS, and JavaScript for the frontend and PHP and MySQL for the backend. All data is stored securely in the database, ensuring easy access and management.

This system provides features such as a user-friendly interface, fast billing process, accurate data handling, and report generation. It helps save time, reduce errors, and improve overall business efficiency.

In conclusion, the Cosmetic Shop Management System is an effective solution for managing shop activities in a simple, fast, and reliable manner.

1.INTRODUCTION

1.1 ABOUT THE PROJECT

The Cosmetic Shop Management System is a software application designed to manage the daily operations of a cosmetic store in an efficient and organized way. It helps in maintaining product details, stock, billing, and customer records digitally, reducing manual work and saving time.

In this project, products from Lakme are used. Lakme offers a variety of cosmetic products such as lipsticks, foundations, face powders, and skincare items that are widely used by customers. These products contain different chemicals like parabens (preservatives to increase shelf life), silicones (for smooth texture), emulsifiers (to mix oil and water), and coloring agents (to give attractive shades).

Overall, this system helps in managing branded products and their details efficiently, including ingredients, price, and stock, while improving accuracy and simplifying billing and sales tracking.

MODULES:

- ❖ Admin Module
- ❖ Product Management Module
- ❖ Purchase Management Module
- ❖ Sales / Billing Module
- ❖ Stock / Inventory Management Module
- ❖ Customer Management Module

2. SYSTEM SPECIFICATION

To be used efficiently, all computer software needs certain hardware components or other software resources to be present on a computer. These pre-requisites are known as (computer) system requirements and are often used as a guideline as opposed to an absolute rule. Most software defines two sets of system requirements: minimum and recommended. With increasing demand for higher processing power and resources in newer versions of software, system requirements tend to increase over time; industry analysts suggest that this trend plays a bigger part in driving upgrades to existing computer systems than technological advancements.

2.1 HARDWARE SPECIFICATION:

The most common set of requirements defined by any operating system or software application is the physical computer resources, also known as hardware. A hardware requirements list is often accompanied by a hardware compatibility list (HCL), especially in case of operating systems. An HCL lists tested, compatible and sometimes incompatible hardware devices for a particular operating system or application. The following sub-sections discuss the various aspects of hardware requirements.

- ❖ Processor : Intel(R) Core(TM) i3-1005G1 CPU @ 1.20GHz (1.19 GHz)
- ❖ RAM : Minimum 2 GB (4 GB Recommended)
- ❖ Hard Disk : 250 GB or above
- ❖ Monitor : 15" LED Monitor
- ❖ Keyboard : Standard 104 keys keyboard
- ❖ Mouse : Optical mouse
- ❖ Printer : For bill printing

2.2 SOFTWARE SPECIFICATION

Software Requirements deal with defining software resource requirements and pre-requisites that need to be installed on a computer to provide optimal functioning of an application. These requirements or pre-requisites are generally not included in the software installation package and need to be installed separately before the software is installed.

- ❖ Operating system : Windows 10
- ❖ Front-END : HTML, CSS, JAVA SCRIPT
- ❖ Back-END : PHP, MY SQL
- ❖ Server : Microsoft SQL Server

2.2.1 FRONTEND DETAILS:

The front-end of the Cosmetic Shop Management System is developed using HTML, CSS, and JavaScript. These technologies are used to design the user interface and provide interaction between the user and the system.

HTML:

HTML (HyperText Markup Language) is used to create the structure of the web pages. It defines elements such as forms, buttons, text fields, and tables used for entering product details, customer information, and billing data.

CASCADING STYLE SHEET:

CSS (Cascading Style Sheets) is used to design and style the web pages. It controls the layout, colors, fonts, and overall appearance of the application, making the system attractive and user-friendly.

JAVA SCRIPT:

JavaScript is used to add functionality and interactivity to the system. It performs tasks such as form validation, calculations in billing, and dynamic updates without reloading the page.

Overall, the combination of HTML, CSS, and JavaScript provides a responsive, interactive, and user-friendly interface for managing the cosmetic shop efficiently.

2.2.2 BACKEND (MYSQL)

The back-end of the Cosmetic Shop Management System is developed using PHP and MySQL. These technologies handle data processing, storage, and communication between the user interface and the database.

PHP:

PHP (Hypertext Preprocessor) is a server-side scripting language used to develop the core functionality of the system. It processes user requests, performs operations like inserting, updating, and deleting data, and connects the front-end with the database.

MY SQL:

MySQL is used as the database to store all the information such as product details, customer records, sales, billing, and stock data. It helps in organizing data in tables and retrieving it efficiently when needed.

The integration of PHP and MySQL ensures secure data handling, faster processing, and reliable performance of the system. It enables real-time updates, accurate record maintenance, and smooth functioning of the cosmetic shop management system.

3.SYSTEM STUDY

3.1 EXISTING SYSTEM

The existing system refers to the current method used in the cosmetic shop before introducing a computerized system. In most small cosmetic shops, the existing system is manual and paper-based.

- ❖ All sales and purchase details are recorded manually in registers.
- ❖ Billing is prepared by hand, which takes more time.
- ❖ Stock is checked physically instead of using a digital system.
- ❖ Customer and supplier details are not stored in a proper database.
- ❖ Preparing reports and checking old records is difficult.
- ❖ There is a high chance of human errors and data loss.

3.1.1 DRAWBACKS OF EXISTING SYSTEM :

- ❖ Time-consuming process due to manual work
- ❖ High chance of human errors in calculations
- ❖ Risk of data loss or damage
- ❖ Slow billing process
- ❖ Difficulty in maintaining stock records
- ❖ Hard to generate reports
- ❖ Poor management of customer details

3.2 PROPOSED SYSTEM

Objective is to overcome the major limitation of the existing enabling effective management of the customer details thereby improving the performance.

- ❖ With improved computerization being involved in the maintenance of customer details, error and inconsistencies can be kept at par.
- ❖ Easy retrieval of data will be made possible by finding techniques.
- ❖ Validation of data will ensure only accurate, valid and complete data is stored in the database.

3.2.1 FEATURES OF PROPOSED SYSTEM :

- ❖ Digital product management (Add, Update, Delete products)
- ❖ Automatic stock management and stock alerts
- ❖ Fast and accurate billing system
- ❖ Customer details storage and management
- ❖ Easy sales tracking and report generation
- ❖ Search option for quick product finding
- ❖ Secure data storage using database
- ❖ User-friendly interface for easy operation
- ❖ Backup and data recovery support

4. SYSTEM DESIGN AND DEVELOPMENT

System Design and Development refers to the process of planning, creating, and implementing a system based on user requirements. System design involves defining the structure, components, modules, and data flow of the system, while system development focuses on coding, testing, and integrating these components to build a complete working system.

In the Cosmetic Shop Management System, this process helps in designing user-friendly interfaces, organizing the database, and developing modules like product management, billing, and reporting. It ensures that the system works efficiently, accurately, and meets the needs of the users.

4.1 FILE DESIGN:

File design refers to how data is stored and organized in the system. In the Cosmetic Shop Management System, different files or tables are created to store product details, customer information, and sales records. Each file contains specific fields such as product ID, name, price, and quantity. This organized structure helps in easy storage, retrieval, and updating of data.

4.2 INPUT DESIGN:

Input design focuses on how data is entered into the system. The system provides user-friendly forms for entering product details, customer information, and billing data. Proper validation is applied to ensure correct data entry, such as allowing only numbers for price and quantity fields. This helps in reducing errors and improving accuracy.

4.3 OUTPUT DESIGN:

Output design defines how the system displays the results to the user. The system generates outputs such as billing receipts, sales reports, and stock details. These outputs are designed to be clear, simple, and easy to understand, helping the shop owner in decision-making.

4.4 DATABASE DESIGN:

Database design involves organizing data into structured tables for efficient storage and management. In this system, tables such as products, customers, and sales are created. Each table contains relevant fields, and relationships are maintained between them. This ensures data security, consistency, and quick access.

4.5 SYSTEM DESIGN:

System design defines the overall structure and working of the system. The front-end is developed using Visual Basic (VB) for user interaction, and the back-end uses MySQL for data storage. The system includes modules like product management, billing, stock management, and report generation, ensuring smooth and efficient operation.

4.5.1 DESCRIPTION OF MODULE

ADMIN MODULE:

The Admin Module is the main controlling unit of the system. The admin has full access to all features and data in the system. This module allows the admin to add or remove users, manage login credentials, and monitor all activities such as product updates, sales, and customer details. It ensures system security by restricting unauthorized access and helps in maintaining overall control and smooth functioning of the application.

PRODUCT MANAGEMENT MODULE:

The Product Management Module is used to handle all product-related operations. The admin can add new cosmetic products, update existing product details, delete unwanted items, and view product lists. It includes details like product name, brand, price, quantity, and expiry date. This module helps in organizing products properly and makes product handling easy and efficient.

PURCHASE MANAGEMENT MODULE:

The Purchase Management Module manages the purchasing process of products from suppliers. It records purchase details such as supplier name, product name, quantity, purchase price, and date. This module helps in tracking all incoming products and ensures that the shop always has sufficient stock. It also helps in maintaining proper purchase history for future reference.

SALES / BILLING MODULE:

The Sales or Billing Module is responsible for handling customer purchases and generating bills. It calculates the total amount based on selected products and quantities, applies any discounts if needed, and generates a bill or invoice. It also records every sales transaction in the system, ensuring accurate and fast billing. This module improves customer service by reducing waiting time.

STOCK / INVENTORY MANAGEMENT MODULE:

The Stock or Inventory Management Module keeps track of all available products in the shop. It automatically updates stock levels when products are purchased or sold. This module helps in identifying low-stock items and avoids overstocking or shortages. It ensures proper inventory control and helps the shop owner make better decisions regarding product management.

CUSTOMER MANAGEMENT MODULE:

The Customer Management Module is used to store and manage customer information such as name, contact number, and purchase history. It helps the shop owner understand customer preferences and provide better service. This module also helps in maintaining long- term relationships with customers and improving customer satisfaction.

5. SYSTEM TESTING AND IMPLEMENTATION

System Testing and Implementation is a crucial phase in the development of the Cosmetic Shop Management System. In this phase, the system is tested to ensure that all modules work correctly without errors. Testing is done to verify input, output, and overall system performance. It helps in identifying bugs and improving the reliability and accuracy of the system.

5.1 UNIT TESTING

Unit Testing is done to test each module individually. In this system, modules like Product Management, Billing, and Stock Management are tested separately to check whether each function works correctly. It helps in identifying errors at an early stage.

5.2 INTEGRATION TESTING

Integration Testing is done after unit testing. In this, all modules are combined and tested together. For example, when a product is sold, the billing module should update the stock automatically. This testing ensures proper communication between modules.

5.3 SYSTEM TESTING

System Testing is performed on the complete system as a whole. It checks whether the entire Cosmetic Shop Management System works properly according to the requirements. It verifies all functions, performance, and system behavior.

5.4 USER ACCEPTANCE TESTING (UAT)

User Acceptance Testing is done by the actual users (shop owner or staff). They test the system in real-time to check whether it meets their needs and expectations. If the system is user-friendly and works correctly, it is accepted.

5.5 ERROR TESTING

Error Testing checks how the system handles incorrect inputs. For example, entering letters in the price field or leaving required fields empty. The system should show proper error messages and prevent invalid data entry.

5.6 PERFORMANCE TESTING

Performance Testing is used to check the speed and efficiency of the system. It ensures that the system works smoothly even when handling multiple operations like billing and stock updates at the same time.

6.CONCLUSION

The Cosmetic Shop Management System is an efficient and user-friendly application developed to simplify the daily operations of a cosmetic store. It helps in managing product details, stock, billing, and customer information in a systematic and digital way, reducing manual work and errors.

The system supports handling branded products like Lakme and manages their details effectively, including price, quantity, and ingredients such as parabens, emulsifiers, and coloring agents. It ensures accurate record-keeping and quick access to information.

Overall, this system improves efficiency, saves time, enhances accuracy, and provides better management of cosmetic shop activities, making it a reliable solution for modern retail businesses.
